

Supplementary Fig. 1. (A) Microscopic images from the unstimulated platelet mix of a healthy control ($t=0$ min) showing discrete platelet population indicating non-aggregation of platelets during preparation (direct wet mount, $\times 400$). (B-D) Microscopic images from agonist-stimulated platelet mix (ADP, collagen, and ristocetin, respectively) showing formation of platelet-platelet aggregates (black arrows) (direct wet mount, $\times 400$).
